

RUBIN KTW / KTW+

Compound water meter cold water

Applications

This compound water meter is designed for high and sharply fluctuating flows in cold water areas up to 50 °C, measurements for very small flows for leak detection purposes, and firefighting pipelines. Its unique modular technology enables measuring inserts to be easily exchanged, as well as cost-efficient retrofitting with options such as pulse outputs or communications modules.

Features

- High dynamic range
- Main meter and submeter in tandem up to DN 100
- Integrated flow straightener
- Exchangeable measuring insert
- Can be retro-fitted with interference-free modules for remote reading
- Approval 2004/22/EC MID annex MI001

Customer benefits

- Measuring high and sharply fluctuating flows
- Leak detection
- No distinction in performance between left or right submeter up to DN 100
- No inlet and outlet sections required
- Cost-effective exchange of measuring inserts

Operating principle

Small flows are recorded by the by-pass meter (ring piston meter). If the flow volume exceeds a certain value, the main meter changeover valve switches. The changeover valve has a corresponding hysteresis. The main meter is a turbine with specially designed helicoid blades through which water passes. This has little effect on the pipe cross-section in the turbine, meaning very little loss of pressure.

The reading process must always include both meter readouts. Consumption is always the total of both meters.

Constructional design

The meter consists of a basic powder-coated body and a multi-range metrological unit.

The multi-range metrological unit is made up of a main meter (turbine meter with hydrodynamically balanced rotor), a spring-loaded changeover valve with low pressure loss and high resistance to wear, and a by-pass meter (ring piston meter).

The multi-range metrological unit's compact construction enables simple, cost-effective exchange.

The RUBIN KTW+ by-pass meter is mounted laterally.

CAUTION: The submeter mounting side must be given with the order. This will be in a left or right flow direction.

Installation conditions

Installation position

Horizontal or vertical installation. Select the installation position so that the measuring pipe is completely full of water during measurement operation and no air bubbles can collect in the measuring pipe! Vertical installation should therefore preferably be on the standpipe.

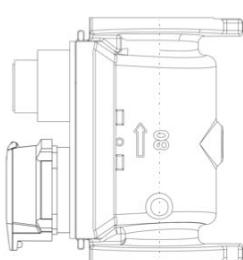

For horizontal installation, position the meter head upwards or to the side +/- 90°.

RUBIN KTW installation position

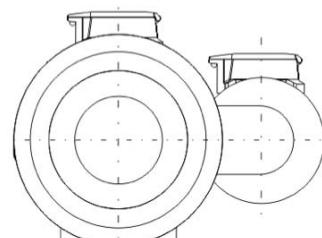

Horizontal installation
Measuring insert rotatable +/- 90°
left or right

RUBIN KTW+ installation position

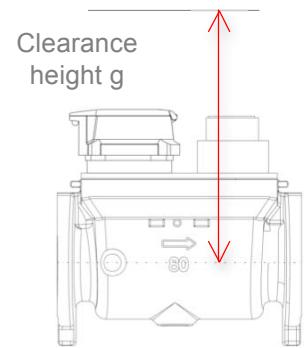

Vertical installation

Horizontal installation
only, measuring head
always facing upwards

Installation and clearance height

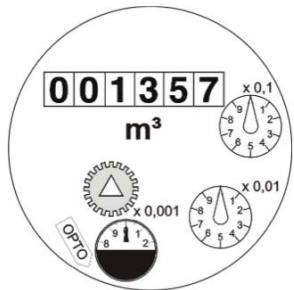

The multi-range metrological units are exchangeable. Always make sure that sufficient upper clearance is available. Recommendations are available in the 'dimensions' section for measurement g.

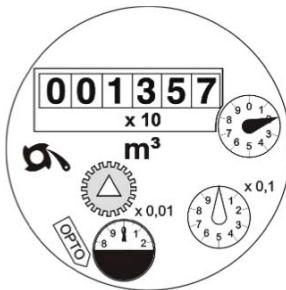

Inlet and outlet sections

The integrated flow straightener means that no inlet or outlet sections are required (U0D0).

Dials / roller counters

By-pass meter

Main meter

The display can be rotated for optimum reading!

Measurement error limits

Accuracy class 2 / T30

Q_1 = lowest flow rate $\pm 5\%$

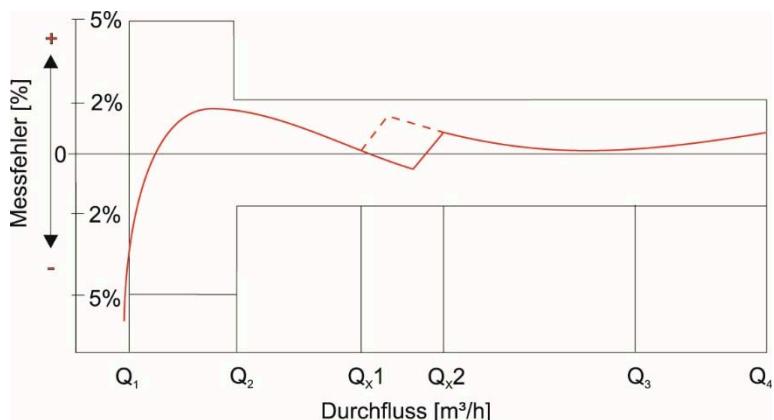

Q_2 = transitional flow rate $\pm 2\%$

Q_3 = continuous flow rate $\pm 2\%$

Q_4 = overload flow rate $\pm 2\%$

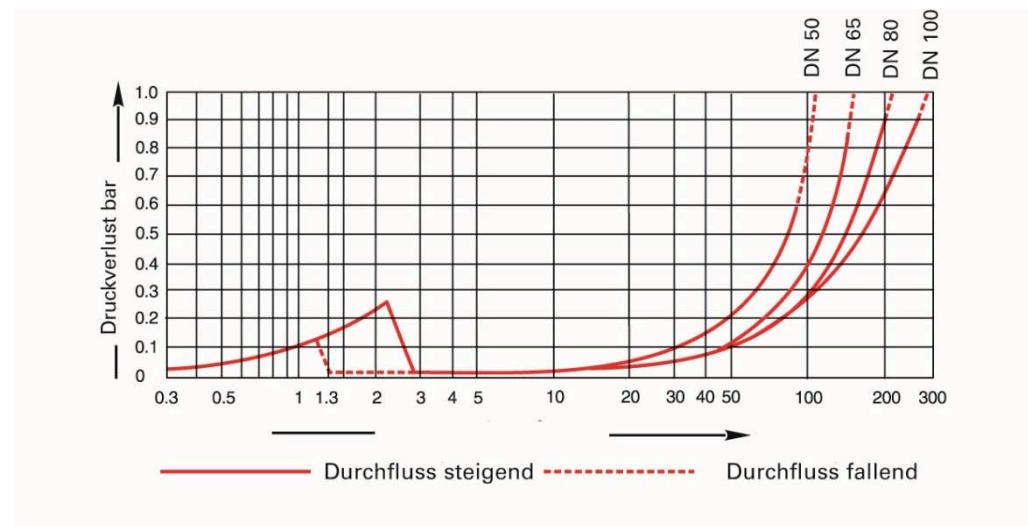

Q_{x1} = changeover with decreasing flow rate

Q_{x2} = changeover with increasing flow rate
